Task 7

AI Business Assistant Platform

Project Overview

The AI Business Assistant Platform is a web-based application that combines multiple AI tools into one platform. It helps users perform AI chat, document analysis, resume review, email writing, meeting summarization, content generation, and coding assistance. The platform uses Google Gemini AI and Streamlit to provide a simple user interface.

Problem Statement

Users often need different websites for different AI tasks. This wastes time and reduces productivity. This platform solves the problem by providing multiple AI services in one application.

Objectives

- Build a complete AI Business Assistant Platform.
- Provide conversational AI.
- Analyze documents using AI and RAG.
- Evaluate resumes with ATS feedback.
- Generate professional emails.
- Summarize meetings.
- Create blogs and social media content.
- Provide coding assistance.

Technologies and Libraries

Technology	Purpose
Python	Backend Programming
Streamlit	Web Application
Google Gemini API	AI Model
MongoDB	Database
FAISS	Vector Database
LangChain	RAG Pipeline
PyMuPDF	Read PDF Files
python-docx	Read DOCX Files
bcrypt	Password Hashing
python-dotenv	Environment Variables

Project Architecture

User → Login/Signup → Select AI Module → Gemini AI → MongoDB / FAISS → Display Result

AI Modules

- AI Chat
- Document AI
- Resume AI
- Email AI
- Meeting AI
- Content AI
- Coding AI

Prompt Engineering

Each AI module uses a dedicated prompt to generate accurate and task-specific responses.

RAG and Vector Database

The Document AI module uses LangChain and FAISS. Documents are converted into embeddings and relevant content is retrieved before generating answers with Gemini AI.

Installation Steps

1. Install Python.
2. Install libraries using: `pip install -r requirements.txt`
3. Create a `.env` file and add the Gemini API key and MongoDB URI.
4. Start MongoDB.
5. Run: `streamlit run app.py`

Conclusion

The AI Business Assistant Platform combines multiple AI-powered tools into one application. It demonstrates the use of Gemini AI, LangChain, FAISS, MongoDB, and Streamlit to build a practical AI solution.
